Common standards schema, IDs, test rules

Integration and expenditure Defined derivative, no second independent care

Protected work Full history remains in the repo of origin; institutional preservation as a process stock.

Tested data package → Integration Source level, index snapshot, rule version and acceptance are connected in the import manifest.

approval → public edition Own dataset with own history. No internal commits are taken over.

1. To combine technical responsibilities of the workplaces with common rules, a well-kept manual and regular integration.
2. Merge TEI, schema, scripts and register levels in designated packages; connect automatic checks and editorial review.
3. Separately regulate expert opinions, publishers and public approval; agree on succession, restoration and permissible process analyses in advance.

▼ Decision paths and data flows as text

The joint integration combines edition data, rule version and index snapshot in the band manifest. Expert reports and publishers receive each designated excerpts; technical corrections return in a controlled manner. Public data are released separately. A model or host change leads to re-examination and replaces no care allowance.
