Back to the case

# One volume is more than one text level

**TEI-version** Unique commit / export
**schema** Properly published version
**index snapshot** Versioned and received?
**Output path** Transformations and dependencies
**Rule knowledge** Manual, schema and profile version
**Release information** Subject matter, jurisdiction, conditions

The restoration is unchecked. A manifesto calls components, but proves neither their preservation nor a functioning reconstruction.

A Git tag can mark a particular file version. The manifest connects the versions of the components; they must actually be available. Make rights information public only to the appropriate extent.
