Back to the case

Work and publication architecture

1. **Local computer:** TEI with prepared support; edit, check and preview files.
2. **Private Labour Repo:** Uni-GitLab with consulting. Conscious comparison with the computer; consultation as own performance.
3. **approval and output:** Select suitable version, check technical as well as with regard to rights/metadata, clean up internal notes and export files without private Git history. Create HTML/PDF if required.
4. **Own public publication repository:** Still open. Released data, documentation and releases; optional web access requires a suitable output path.
5. **Archive service:** defined version passed with metadata; access, long-term responsibility and persistent identifier separately agree.

Current release intent: Internal working version. All expenditures remain planned options; external backup and recovery must be independently checked.

▼ Decision paths and data flows as text

TEI and Markdown are alternative working formats; the processing paths lead back to Git-supported source data. Work host and publication host are separate decisions. After the examination, released data, a possible website and a possible print edition arise. A host change requires additionally the examination of accesses, consulting and tool license.
