Back to the case

Edition compass · Case 03 · Rätselhaft! · Joint version 1.1 · 27 October 2026 · Material

Working with the corpus

From download to first investigation

1. Unpack the small package completely.
2. With Python 3.10 or newer `python untersuchen.py` Run in the package folder.
3. Expected result: three puzzles, three solutions and three demonstrated shapes.
4. In `ausgabe/` Test entries, reference solutions and proof of results are available separately.

Only Python default library, no account and no API. The script uses relative paths. The TEI file can also be processed with other XML tools. This entry checks identifiers and solution references, not TEI-schema.

Select Release

Described dataset and known limits.

▼ Example and Tip

Example: Elif uses v1.0 instead of the now extended main.

Tip: Check release package and known limits before selection.

→
Hold selection

What riddles, solutions and layers?

▼ Example and Tip

Example: Four puzzle identifiers are compared in both releases.

Tip: Save the identifiers or the executable selection rule in the analysis project.

→

Check Locally

Documented extraction, script and environment.

▼ Example and Tip

Example: A designated script processes the download without server access.

Tip: Document extraction, parameters and dependencies together with the script.

→

Share findings

Result with data and process proof.

▼ Example and Tip

Example: The figure is called corpus release, selection and the analysis manifest.

Tip: Results, including the methods and data references used.
